

This sample project demonstrates how you can get tooltip popups for your acronyms, along with highlighting in bold and color the original acronym definition.

Upload `acronymtooltips.sty`, `acronymtooltips-pdfcomment.tex`, and `myacronyms.tex` to Overleaf, then use `\usepackage{acronymtooltips}` and `\input{myacronyms}` in your preamble.

Use `\xx{ac}` for singular form and `\xxx{ac}` for plural form.

See *myacronyms.tex* for your acronym definitions and *acronymtooltips.sty* for colors and tooltip logic.

Here is some sample text: Testing Optical Flow (**OF**) algorithms is hard because OF requires good Ground Truth (**GT**) data. Also, you need lots of Block RAM (**BRAM**) because OF takes a lot of memory, particularly for Block Matching (**BM**). BM produces flow vectors and can be combined with corner detection to disambiguate flow along edges. It is much more useful than simplified biologically-inspired Direction Selective (**DS**) flow. But BRAM is costly. Using many BRAMs will cost you a lot of money for big Field Programmable Gate Array (**FPGA**). But it enabled BM OF on FPGAs, more accurate than DS models of the past and results much closer to GT flow.
